

Claim Amendments:

Please amend the claims as indicated:

1. (Canceled)
2. (Currently Amended) The method of ~~claim 1~~claim 6, wherein the target material is a semiconductor substrate.
3. (Currently Amended) The method of claim 6~~Claim 1~~, wherein the target material is any substance to be implanted using the ion beam.
4. (Canceled)
5. (Currently Amended) The method of claim 6~~claim 1~~, wherein a characteristic is selected from a group consisting of: beam current, beam energy, beam scan rate, vacuum, gas pressure, and ion dose.
6. (Currently Amended) A method of exposing a target material to an ion beam in an ion implantation system, the method comprising~~The method of claim 1, wherein the step of~~
quantifying includes:
detecting an ion beam at a first location with a first detector;
detecting the ion beam at a second location with a second detector at the same time as the
first detector;
quantifying an amount of ion beam neutralization based upon a measurement deviation
between the first detector and the second detector, wherein the step of quantifying
includes
determining a reference ratio at a first ion beam current at the first location of a
processing chamber and the second location of a processing chamber,
wherein the first location is further from a first target of the ion beam than
the second location;

determining a current ratio of a second ion beam current at the first location and the second location, wherein the second ion beam current is being used to process a second ~~target;~~target; and determining a charge neutralization component of the ion beam at the second target location based on the reference ratio and the current ~~ratio;~~ratio; and controlling a characteristic of the ion beam of the implantation system based upon the amount of ion beam neutralization.

7. (Original) The method of Claim 6, wherein the reference ratio is determined when a relatively high-level, stable vacuum exists along the ion beam line and no target material is present.

8. (Original) The method of Claim 6, wherein the reference ratio is determined at the beginning of implantation when a relatively high-level, stable vacuum exists along the ion beam line and target material is present.

9. (Currently Amended) The method of claim 6~~claim 1~~, wherein ~~the step of~~controlling includes:

modifying the ion dose based upon the charge neutralization component to create a total dose; and

adjusting a process parameter based on the total dose.

10. (Original) The method of claim 9, wherein a process parameter is selected from a group consisting of: beam current, beam energy, beam scan rate, vacuum, gas pressure, and ion dose.

11. (Currently Amended) The method of claim 6~~Claim 1~~, wherein the second ~~device~~ detector is fixed in place and sited adjacent to the target position.

12. (Currently Amended) The method of ~~claim 6~~Claim 1, wherein the second ~~device~~
detector is moveable and sited adjacent to the target position during measurement.

13. (Currently Amended) The method of ~~claim 6~~Claim 1, wherein the second ~~device~~
detector is fixed in place and sited behind the target position.

14. (Currently Amended) The method of ~~claim 6~~Claim 1, wherein the second ~~device~~
detector is moveable and sited behind the target position.

15. (Currently Amended) The method of ~~claim 6~~Claim 1, wherein the second ~~device~~
detector is sited along the beam path to the target position.

16. (Original) The method of Claim 6, wherein the reference ratio is in the range of
approximately 100:1 to 1:1.

17. (Previously Presented) The method of claim 16, wherein the range of the reference
ratio is dependent upon the location of a first detector with reference to a second detector.

18. (Original) The method of Claim 16, wherein the reference ratio may be a previously
stored value retrieved from control software.

19. (Canceled)

20. (Canceled)

21. (Currently Amended) The system of ~~claim 19~~claim 22, wherein a characteristic is
selected from a group consisting of: beam current, beam energy, beam scan rate, vacuum, gas
pressure, and ion dose.

22. (Currently Amended) ~~The system of claim 19, wherein the step of quantifying~~
~~includes~~A system comprising:
memory;

a processor operably connected to said memory;
a program of instructions, said program of instructions including instructions to receive a
first measurement from a first detector and to receive a second measurement from
a second detector, and to manipulate said processor to:
quantify an amount of ion beam neutralization based upon a measurement deviation
between the first detector and the second detector, wherein the first detector and
the second detector measure an ion beam at the same time, where to quantify
includes
determining a reference ratio at a first ion beam current at a first location of a processing
chamber and a second location of a processing chamber, wherein the first location
is further from a first target of the ion beam than the second location;
determining a current ratio of a second ion beam current at the first location and the
second location, wherein the second ion beam current is being used to process a
second target;
determining a charge neutralization component of the ion beam at the second target
location based on the reference ratio and the current ratio; and
control a characteristic of the ion beam of an ion implantation system based upon the
amount of ion beam neutralization.

23. (Currently Amended) The system of ~~claim 19~~claim 22, wherein the step of
controlling includes:
modifying the ion dose based upon the charge neutralization component to create a total
dose; and
adjusting a process parameter based on the total dose.

24. (Original) The system of claim 23, wherein a process parameter is selected from a
group consisting of:
beam current, beam energy, beam scan rate, vacuum, gas pressure, and ion dose.

25. (New) A method of exposing a target material to an ion beam in an ion implantation system, the method comprising:

detecting an ion beam at a first location with a first detector;

detecting the ion beam at a second location with a second detector at the same time as the first detector, wherein the second detector is moveable and sited along the beam path to the target position;

quantifying an amount of ion beam neutralization based upon a measurement deviation between the first detector and the second detector; and

controlling a characteristic of the ion beam of the implantation system based upon the amount of ion beam neutralization.

26. (New) A method of exposing a target material to an ion beam in an ion implantation system, the method comprising:

detecting an ion beam at a first location with a first detector;

detecting the ion beam at a second location with a second detector at the same time as the first detector, wherein the second detector is sited along the beam path to the target position;

quantifying an amount of ion beam neutralization based upon a measurement deviation between the first detector and the second detector; and

controlling a characteristic of the ion beam of the implantation system based upon the amount of ion beam neutralization.
